Contents

1	Making a customized rootfs (bootstrap)	1
2	Customization and Parameterization based on the bootstrap	1
3	Creating an installer for the prepared distribution	1

1 Making a customized rootfs (bootstrap)

The bootstrap is creating a root filesystem able to boot into a shell with network and apt supports.

- Methods to work on the rootfs (development purpose) Using QEMU

2 Customization and Parameterization based on the bootstrap

This part will be ignored for now.

3 Creating an installer for the prepared distribution

- Installer same as <https://wiki.debian.org/DebianInstaller>
- Making ISO image with the Installer
